

# General Plane Motion

$$\vec{V}_B = \vec{V}_A + \vec{V}_{B/A}$$

$$\vec{V}_B = \vec{V}_A + \omega \mathbf{k} \times \vec{r}_{B/A}$$

$$\begin{aligned} \vec{V}_{B/A} &= \vec{\omega} \times \vec{r}_{B/A} \quad 3D \\ &= \omega \mathbf{k} \times \vec{r}_{B/A} \end{aligned}$$

$$V_{B/A} = r_{B/A} \omega$$

+

$$v_B = v_A + v_{B/A}$$

$$\frac{v_B}{v_A} = \tan \theta$$

$$v_B = v_A \tan \theta$$

$$v_{B/A} = r_{B/A} \omega$$

$$\frac{v_{B/A}}{l} = \omega = \frac{v_A}{l \cos \theta}$$

**15.39** An overhead door is guided by wheels at  $A$  and  $B$  that roll in horizontal and vertical tracks. Knowing that when  $\theta = 30^\circ$  the velocity of wheel  $B$  is 2 ft/s downward, determine (a) the angular velocity of the door, (b) the velocity of end  $D$  of the door.

$$V_{B/A} = v\omega$$

$$V_{B/A} = 5\omega$$

$$\frac{V_B}{5} = \omega$$

$$\omega = \boxed{0.8 \text{ rad/s}}$$

$$\frac{V_B}{V_A} = \tan 30^\circ$$

$$V_A = \frac{V_B}{\tan 30^\circ} = \frac{2}{\tan 30^\circ} = 3.46 \text{ ft/s}$$

$$\sin \theta = \frac{V_B}{V_{B/A}}$$

$$V_{B/A} = \frac{V_B}{\sin 30^\circ} = \frac{2}{\sin 30^\circ} = 4 \text{ ft/s}$$

$$\begin{aligned} \vec{V}_D &= \vec{V}_A + \omega \mathbf{k} \times \vec{r}_{D/A} \\ &= 3.46\mathbf{i} - (0.8 \mathbf{k} \times 10 \sin 30^\circ \mathbf{i} - 10 \cos 30^\circ \mathbf{j}) \end{aligned}$$

$$V_{D/A} = -0.8k \times 10 \sin 30^\circ i - 10 \cos 30^\circ j$$

$$= -0.8k \times 5i - 8.66j$$

$$= \begin{vmatrix} i & j & k \\ 0 & 0 & -0.8 \\ 5 & -8.66 & 0 \end{vmatrix} \begin{vmatrix} i & j \\ 0 & 0 \\ 5 & -8.66 \end{vmatrix}$$

$$= -0.8 \cdot 5j - (-0.8)(-8.66)i$$

$$= -6.93i - 4j \text{ ft/s}$$

$$\vec{V}_D = \vec{V}_A + V_{D/A}$$

$$= 3.46i - 6.93i - 4j = \boxed{-3.47i - 4j = V_D}$$

- 15.38** An automobile travels to the right at a constant speed of 48 mi/h. If the diameter of a wheel is 22 in., determine the velocities of points  $B$ ,  $C$ ,  $D$ , and  $E$  on the rim of the wheel.

$$V_C = V_A + V_{CA}$$
