## trans.exe Exercises for Chapter trans Exercise <u>trans.truman</u> \_\_\_\_\_/25 p. Consider the i/o ODE with independent variable t and dependent variable y: $7\dot{\mathbf{y}} + \mathbf{y} = \dot{\mathbf{u}} - 5\mathbf{u}$ with input $\mathfrak{u}(t)=\mathfrak{u}_r$ the unit ramp function. b. Find the characteristic response $y_r$ of the system to the unit ramp input. Stongly $t - \tau(1 - e^{-t/\tau}) = y_r = t - \tau + \tau e^{-t/\tau}$ a. What is the time constant $\tau$ ? $\tau = 7$ consider using Table firsto.1. c. What is the forced response $y_{fo}$ to the same input? d. What is the free response of the $y_{fr}$ to $= 1 - e^{-\frac{t}{2}} x - 5 (t - \tau + \tau)$ e. What is the total response $y_t$ when both the input u and intitial condition y(0) are $y(t) = y_{t_0}(t) + y_{t_0}(t)$ $= 8e^{-t/\tau} + 1 - e^{-t/\tau} - s(t - \tau + \tau e^{-t/\tau})$ $= 8e^{-t/\tau} + 1 - e^{-t/\tau} - s\tau - s\tau + s\tau e^{-t/\tau}$ $= 1 - s\tau - s\tau + se^{-t/\tau} - e^{-t/\tau} + s\tau e^{-t/\tau}$ applied simultaneously? Exercise trans.mogul Consider the i/o ODE with independent variable t and dependent variable y: $= 1 - 35 - 5 + + (8 - 1 + 35)e^{-\frac{1}{7}}$ $= 42e^{-\frac{1}{7}} - 5 + -34$ $\ddot{y}+5\dot{y}+25y=2\dot{u}+3u$ with input $\mathfrak{u}(t)=\mathfrak{u}_s$ the unit step function. a. What are the natural frequency $\omega_{\pi}$ and damping ratio ζ? b. Find the characteristic response of the system to the unit step input. Stongly consider using Table secondo.1. c. What is the forced response to the unit step input?

## State-space response

ssresp

## 1 Recall that, for a state-space model, the state

x, input u, and output y vectors interact through two equations:  $\frac{dx}{dt} = f(x,u,t) \eqno(1a)$ 

$$\frac{d}{dt} = f(x, u, t)$$
 (1a)  
 
$$y = g(x, u, t)$$
 (1b)

where f and g are vector-valued functions that depend on the system. Together, they comprise what is called a state-space model of a system.

2 In accordance with the definition of a state-determined system given an initial

 $\label{eq:condition} 2 \quad \text{In accordance with the definition of a state-determined system, given an initial condition } x(t_0) \text{ and input } u, \text{ the state } x \text{ is determined for all } t \geqslant t_0. \text{ Determining the state response requires the solution—analytic or numerical—of the vector differential equation} \\ For the state response requires the solution and the state response requires the state response requires the state response requires the solution and the state response requires response requires the state response requires response requires requires response requires response requires requires response requires requires response requires req$ 

3 The second equation (1b) is algebraic. It expresses how the output y can be constructed

from the state x and input u. This means we must first solve the state equation (1a) for x, then the output y is given by Eq. 1b.  $4 \quad \text{Just because we know that, for a} \\ \text{state-determined system, there exists a solution to Eq. 1a, doesn't mean we know how to find it. In general, <math>f: \mathbb{R}^n \times \mathbb{R}^r \times \mathbb{R} \to \mathbb{R}^n$  and  $g: \mathbb{R}^n \times \mathbb{R}^r \times \mathbb{R} \to \mathbb{R}^m$  can be nonlinear functions. We don't know how to solve most nonlinear state equations analytically. An additional complication can arise when, in addition to states and inputs, system parameters are themselves time-varying (note the explicit time t argument of f and g). Fortunately, often a linear, time-invariant (LTI) model is sufficient.

5 Recall that an LTI state-space model is of the

$$\frac{dx}{dt} = Ax + Bu$$
 (2a)  
$$y = Cx + Du,$$
 (2b)

where A, B, C, and D are constant matrices containing system lumped-parameters such as mass or inductance. See Chapter ss for details on the derivation of such models.

6 In this chapter, we learn to solve Eq. 2a for the state response and substitute the result into Eq. 2b for the output response. First, we learn an analytic solution technique. Afterward, we learn simple software tools for numerical solution techniques.

1. Technically, since  $\boldsymbol{x}$  and  $\boldsymbol{u}$  are themselves functions,  $\boldsymbol{f}$  and  $\boldsymbol{g}$  are functionals.
