

**trans.firso First-order systems in transient response**

1 First order systems have input-output differential equations of the form

$$\tau \frac{dy}{dt} + y = b_1 \frac{du}{dt} + b_0 u \quad (1)$$

with  $\tau \in \mathbb{R}$  called the time constant of the system. Systems with a single energy storage element—such as those with electrical or thermal capacitance—can be modeled as first-order.

2 The characteristic equation yields a single root  $\lambda = -1/\tau$ , so the homogeneous solution  $y_h$ , for constant  $k \in \mathbb{R}$ , is

$$y_h(t) = k e^{-t/\tau}$$

Free response

3 The free response  $y_f$  of a system is its response to initial conditions and no forcing ( $f(t) = 0$ ). This is useful for two reasons:

1. perturbations of the system from equilibrium result in free response and
2. from superposition, the free response can be added to a forced response to find the specific response:  $y(t) = y_f(t) + y_{fo}(t)$ . This allows us to use tables of solutions like Table firsto.1 to construct solutions for systems with nonzero initial conditions with forcing.

4 The free response is found by applying initial conditions to the homogeneous solution. With initial condition  $y(0)$ , the free response is

$$y_f(t) = y(0) e^{-t/\tau}, \quad (2)$$

which begins at  $y(0)$  and decays exponentially to zero.

Step response

5 In what follows, we develop forced response  $y_{fo}$  solutions, which are the specific solution responses of systems to given inputs and zero initial conditions: all initial conditions set to zero.

6 If we consider the common situation that  $b_1 = 0$  and  $u(t) = K u_s(t)$  for some  $K \in \mathbb{R}$ , the solution to Equation 1 is

$$y_{fo}(t) = K b_0 (1 - e^{-t/\tau})$$

The non-steady term is simply a constant scaling of a decaying exponential.

7 A plot of the step response is shown in Figure firsto.1. As with the free response, within  $5\tau$  the transient response is less than 1% of the difference between  $y(0)$  and steady-state.

Impulse and ramp responses

8 The response to all three singularity inputs are included in Table firsto.1. These can be

Figure firsto.1: free and forced responses and their sum for a first order system with input  $u(t) = K u_s(t)$ , initial condition  $y(0)$ , and  $b_1 = 0$ .

combined with the free response of Equation 2 using superposition. Results could be described as 'bitchin'.

Table firsto.1: first-order system characteristic and total forced responses for singularity inputs. The relevant differential equation is of the standard form  $\tau \dot{y} + y = f$ .

$u(t)$	characteristic response $f(t) = u(t)$	total forced response $y_{fo}$ for $t \geq 0$
$\delta(t)$	$\frac{1}{\tau} e^{-t/\tau}$	$\frac{b_1}{\tau} \delta(t) + \left( \frac{b_0}{\tau} - \frac{b_1}{\tau^2} \right) e^{-t/\tau}$
$u_s(t)$	$1 - e^{-t/\tau}$	$b_0 - \left( b_0 - \frac{b_1}{\tau} \right) e^{-t/\tau}$
$u_r(t)$	$t - \tau(1 - e^{-t/\tau})$	$b_0 t + (b_1 - b_0 \tau)(1 - e^{-t/\tau})$

**Example trans.firso-1**

**re: RC-circuit response the easy way**

Consider a parallel RC-circuit with input current  $I_S(t) = 2u_s(t)$  A, initial capacitor voltage  $v_C(0) = 3$  V, resistance  $R = 1000 \Omega$ , and capacitance  $C = 1$  mF. Proceeding with the usual analysis would produce the io differential equation

$$C \frac{dv_C}{dt} + v_C/R = I_S.$$

Use Table firsto.1 to find  $v_C(t)$ .

$$y = v_C \quad u = I_S = 2u_s$$

$$C \frac{dv_C}{dt} + \frac{v_C}{R} = I_S$$

$$RC \frac{dv_C}{dt} + v_C = R I_S$$

$$\tau = RC \quad b_1 = 0 \quad b_0 = R$$

$$y_{fr}(t) = y(0) e^{-t/\tau} = 3 e^{-t/\tau}$$

$$f(t) = u_s(t)$$

$$y_r = 1 - e^{-t/\tau}$$

$$f(t) = 2R u_s(t)$$

$$y_{fo} = 2R y_r = 2R (1 - e^{-t/\tau})$$

$$\begin{aligned} y(t) &= y_{fr}(t) + y_{fo}(t) \\ &= 3e^{-t/\tau} + 2R(1 - e^{-t/\tau}) \\ &= 3e^{-t/\tau} + 2R - 2R e^{-t/\tau} \\ &= 2R + (3 - 2R) e^{-t/\tau} \end{aligned}$$

$$\begin{aligned} f(t) &= u_s(t) \\ y_r(t) &= 1 - e^{-t/\tau} \\ y_{fo}(t) &= b_1 y_r + b_0 y_r \\ &= b_1 \frac{1}{\tau} e^{-t/\tau} + b_0 (1 - e^{-t/\tau}) \\ &= \frac{b_1}{\tau} e^{-t/\tau} + b_0 - b_0 e^{-t/\tau} \\ &= b_0 - \left( b_0 - \frac{b_1}{\tau} \right) e^{-t/\tau} \end{aligned}$$
