

02.4 Exploring C-pointers

Assigning to a pointee

The function `fgets_keypad`, the source for which is shown in the introduction to [Lab Exercise 02](#), was used in [Lab Exercise 01](#). Recall that in `double_in` we supplied as arguments to `fgets_keypad` a character array (pointer) and its length. Instead of returning the string, the function wrote to the character array it was supplied—but remember: inside a C function arguments are assigned automatic variables. How does `fgets_keypad` assign to the array when it knows only a pointer to its first element? The secret sauce is to assign through a dereferenced pointer. Examine the source for `fgets_keypad` or consider the following example.

```
#include <stdio.h>
void foo(int * p);

int main() {
    static int x = 0;
    static int * p = &x;
    printf("before: %d\n",*p);
    foo(p);
    printf("after: %d",*p);
    return 0;
}

void foo(int * p) {
    *p = 3;
}
```

```
before: 0
after: 3
```

Note that, while this sort of structure is rare among higher-level programming languages, it is quite common in C. For instance, `fgets` and `gets` have this same feature.
